

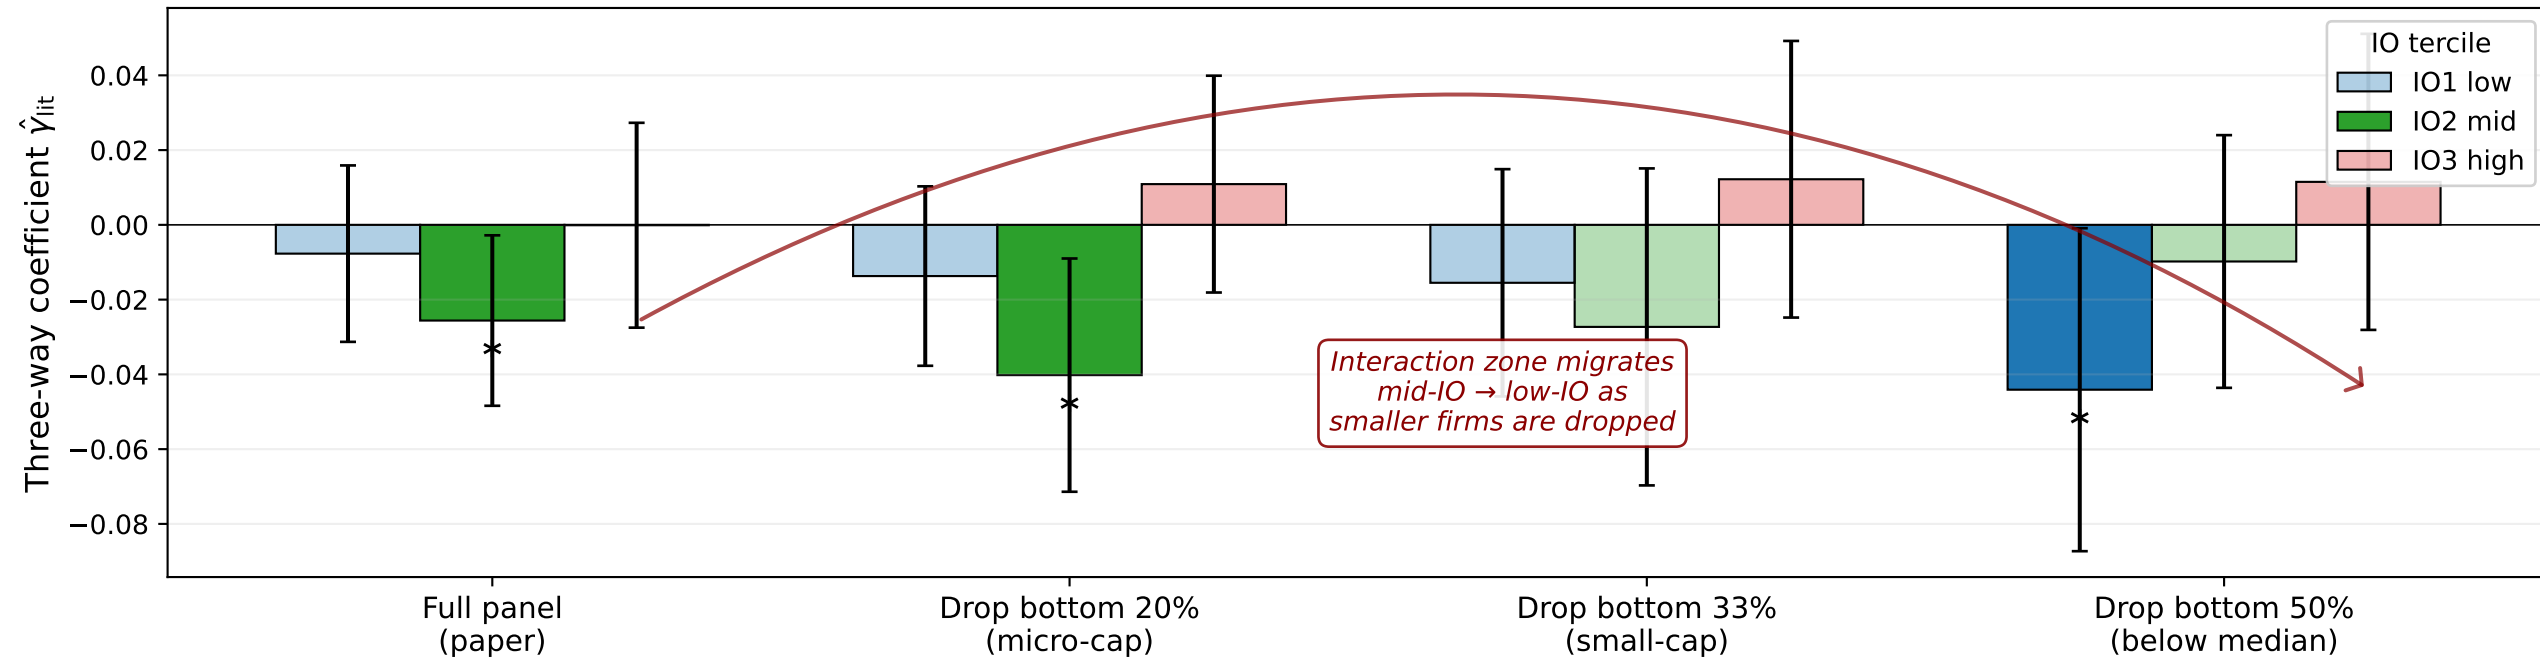

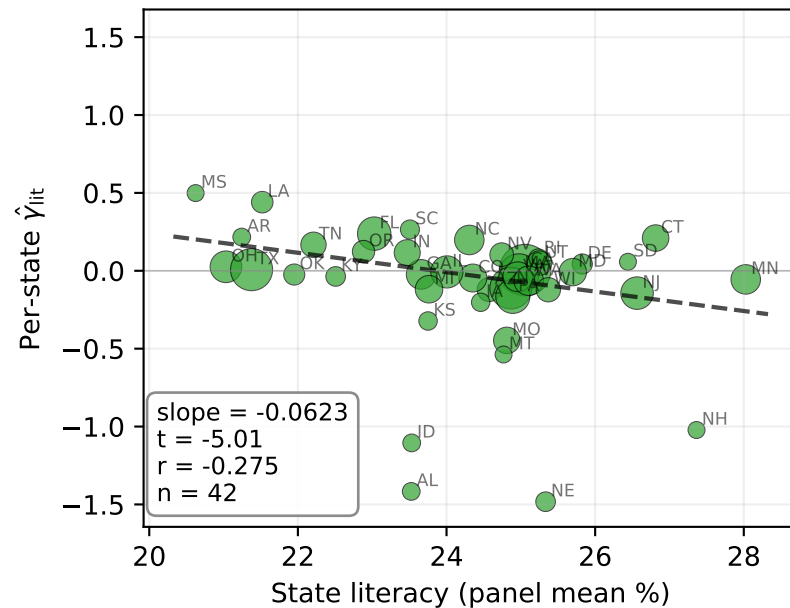

Figure 2: Interaction-zone migration across sample size restrictions
The mid-IO finding is sample-conditional. The underlying object is the size $\times$ ownership interaction zone.

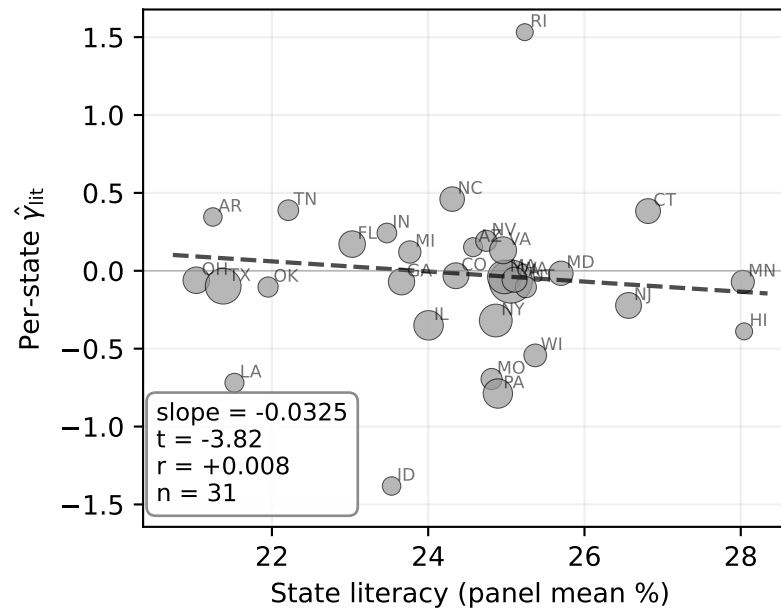

Panel A: Within-panel $\hat{\gamma}_{lit}$ by IO tercile under progressive size filters
 (size-controlled spec; whiskers = ± 2 SE; * = $|t| \geq 2$)

Full panel $\cdot$ mid-IO
 (headline cell)

Above-median size $\cdot$ mid-IO
 (loses the gradient)

Above-median size $\cdot$ low-IO
 (migrated headline cell)
